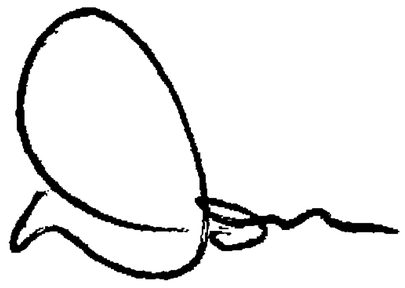
Document # 467

Ex Libris David T. Craig

David,
This is as much as I've had time to do so far.



June 2001

DOS BOOT FLOW OF CONTROL (VERSION 3.2)

1) USER ENTERS "s^P" TO MONITOR OR "PR#s" TO BASIC (WHERE s IS THE DISK SLOT, 1-7, AND ^P IS CONTROL-P)

   (a) MONITOR ROUTINE GETS CONTROL, CONVERTS s TO ADDRESS OF ROM ON BOARD IN SLOT s, $Cs00. THIS ADDRESS IS PLACED AT CSWL ($36) AS THE "OUTPUT INTERCEPT ADDRESS". WHENEVER OUTPUT IS TO BE PLACED ON THE VIDEO SCREEN, THE ROUTINE AT $Cs00 WILL RECEIVE CONTROL.

   (b) STANDARD MONITOR PROCESSING CONTINUES. WHEN THE PROMPT (EITHER ">" OR "*") IS TO BE DISPLAYED, ...

2) THE DISK CONTROLLER CARD ROM BOOT PROGRAM AT $Cs00 BEGINS EXECUTION.

   (a) LET'S CALL THIS 256-BYTE ROM PROGRAM "BOOT PHASE 1". BOOT PHASE 1 TURNS DRIVE 1 IN SLOT s ON AND "RECALIBRATES" THE DISK ARM (MOVES IT TO TRACK 0 AT THE OUTMOST CIRCUMFERENCE). THIS CREATES THE CLICKING SOUND FOR A FEW SECONDS.

(b) PHASE 1 THEN READS THE FIRST 256-BYTE SECTOR ON THAT TRACK (TRACK Ø, SECTOR Ø) INTO RAM PAGE 3 ($3ØØ - $3FF).

(c) IF THIS IS SUCCESSFUL (A CHECKSUM IS CALCULATED AND COMPARED WITH ONE AT $3ØØ), THE RAM EOOT PHASE 2 PROGRAM HAS BEEN LOADED. PHASE 1 (AT $C5F9) JUMPS TO THIS ROUTINE TO CONTINUE DOS BOOT...

3) RAM BOOT PHASE 2 AT $3Ø1 BEGINS EXECUTION.

(a) USING THE SUBROUTINE LOCATED IN ROM BOOT PHASE 1 AT $C5D WHICH READS DISK SECTORS ON TRACK Ø, RAM EOOT PHASE 2 READS THE NEXT 9 SECTORS ON TRACK Ø (TRACK Ø SECTOR 1 TO TRACK Ø SECTOR 9) TO RAM PAGES $36 TO $3F ($36ØØ - $3FFF) FOR A "MASTER" DISKETTE OR 16K "SLAVE", TO $76ØØ - $7FFF F A 32K SLAVE, OR TO $B6ØØ - $BFFF FOR A 48K SLAVE.

(b) THESE LOCATIONS $*6ØØ - $*FFF PERFORM TWO FUNCTIO

- IT WILL EVENTUALLY BE THE SECOND HALF OF DOS, INCLUDING "RWTS" (THE "READ-WRITE-TRACK-SECTOR" PROGRAM
- THE ROUTINE AT $*7ØØ IS NEEDED FOR FINAL LOADING

(c) RAM PHASE 2 (AT $343) JUMPS TO $X700 TO FINISH BOOTING ...

4) RAM BOOT PHASE 3 AT $X700 BEGINS EXECUTION

(a) THIS WILL LOAD ALL REMAINING PARTS OF DOS WHICH ARE DEPENDENT ON DOS RELEASE (VERSION NUMBER) AND WHETHER DISKETTE IS A "SLAVE" OR A "MASTER"

(b) IF MASTER: USING THE RWTS ROUTINE AT $XD00, RAM BOOT PHASE 3 LOADS THE FIRST HALF OF DOS INTO RAM. THIS COMPRISES THE NEXT 27 SECTORS ON THE DISK (TRACK 0 SECTOR $A TO TRACK 2 SECTOR $D). THESE ARE READ INTO RAM PAGES $1B TO $35 ($1B00 TO $35FF), BUMPING UP AGAINST DOS 2ND HALF AT $3600 LOADED IN STEP (3) ABOVE. DOS IS NOW COMPLETELY LOADED. BUT, THE ACTUAL DOS BEGINS AT $1D00 AND EXTENDS TO $3FFF, SET UP TO RUN AS IS ON A 16K MACHINE ONLY. A "MASTER" DOS IS TO RUN ON ANY SIZE APPLE (ABOVE 16K) SO A "DOS RELOCATOR" PROGRAM WAS INCLUDED AT $1B00 - $1CFF ABOVE THIS DOS. ROM BOOT PHASE 3 (AT $3747)

JUMPS TO $1B03 (RELOCATOR ENTRY POINT) TO CREATE A DOS FOR THAT DISK SIZE MACHINE, SEE STEP (5).

(c) IF SLAVE! FOR A SLAVE DISKETTE, RAM BOOT PHASE 3 LOADS A PRE-RELOCATED FIRST HALF OF DOS (CORRECT AT THE TIME OF THE DISK "INIT") DIRECTLY INTO $1D00 - $35FF (16K), OR $5D00 - $75FF (32K), OR $9D00-$B5FF (48 THIS IS OBTAINED FROM THE NEXT 9E DISK SECTORS TRACK 0 SECTOR $A TO TRACK 2 SECTOR $B. THE RELOCATOR IS NOT INCLUDED AND NOT USED, SINCE THIS DOS IS ALREADY RELOCATED. (NOTE: IT MAY BE THE WRONG DOS FOR THE SIZE MACHINE). HERE RAM BOOT PHASE 3 AT $x747 DOES NOT JUMP TO $1B03 RELOCATOR BUT DIRECTLY TO DOS COLDSTART PROCESSING AT $xD84. BOOT IS COMPLETE, SKIP TO STEP (6).

5) DOS RELOCATOR AT $1800 BEGINS EXECUTION (MASTER DISKETTE ONLY).

(a) RELOCATOR IS IN RAM $1500 - $1CFF. UNRELOCATED DOS IS IN RAM $1000 - $3FFF. RELOCATOR FIRST FINDS THE LAST PAGE WHERE RAM ACTUALLY EXISTS ($FF ON 64K, $7F ON 32K, $BF ON 48K MACHINES).

(b)

(c) TO FORCE DOS TO BE AT THE HIGHEST RAM LOCATIONS POSSIBLE, $1000 - $3FFF IS RELOCATED TO $5000 - $7FFF (32K) OR $9000 - $BFFF (48K). IF 16K MACHINE IS USED, RELOCATOR HAS NOTHING TO DO BUT JUMP (AT $1B61) TO DOS COLDSTART. (SEE STEP (6)).

(d) (MACHINES LARGER THAN 16K ONLY): USING A TABLE OF ADDRESS RANGES (AT $1C29), RELOCATOR FIRST RELOCATES ALL 2-BYTE DOS ADDRESS CONSTANTS.

(e) USING ANOTHER SIMILAR TABLE (AT $1C5A) RELOCATOR RELOCATES ALL 3-BYTE 6502 INSTRUCTIONS WHOSE ABSOLUTE ADDRESSES ARE WITHIN PAGES $1D-$BF.

(f) RELOCATOR COPIES THE NEW DOS ($1D00-$3[illegible] TO THE TOP OF RAM WHERE IT SHOULD RESIDE ($5D00-$7FFF OR $9D00-$BFFF

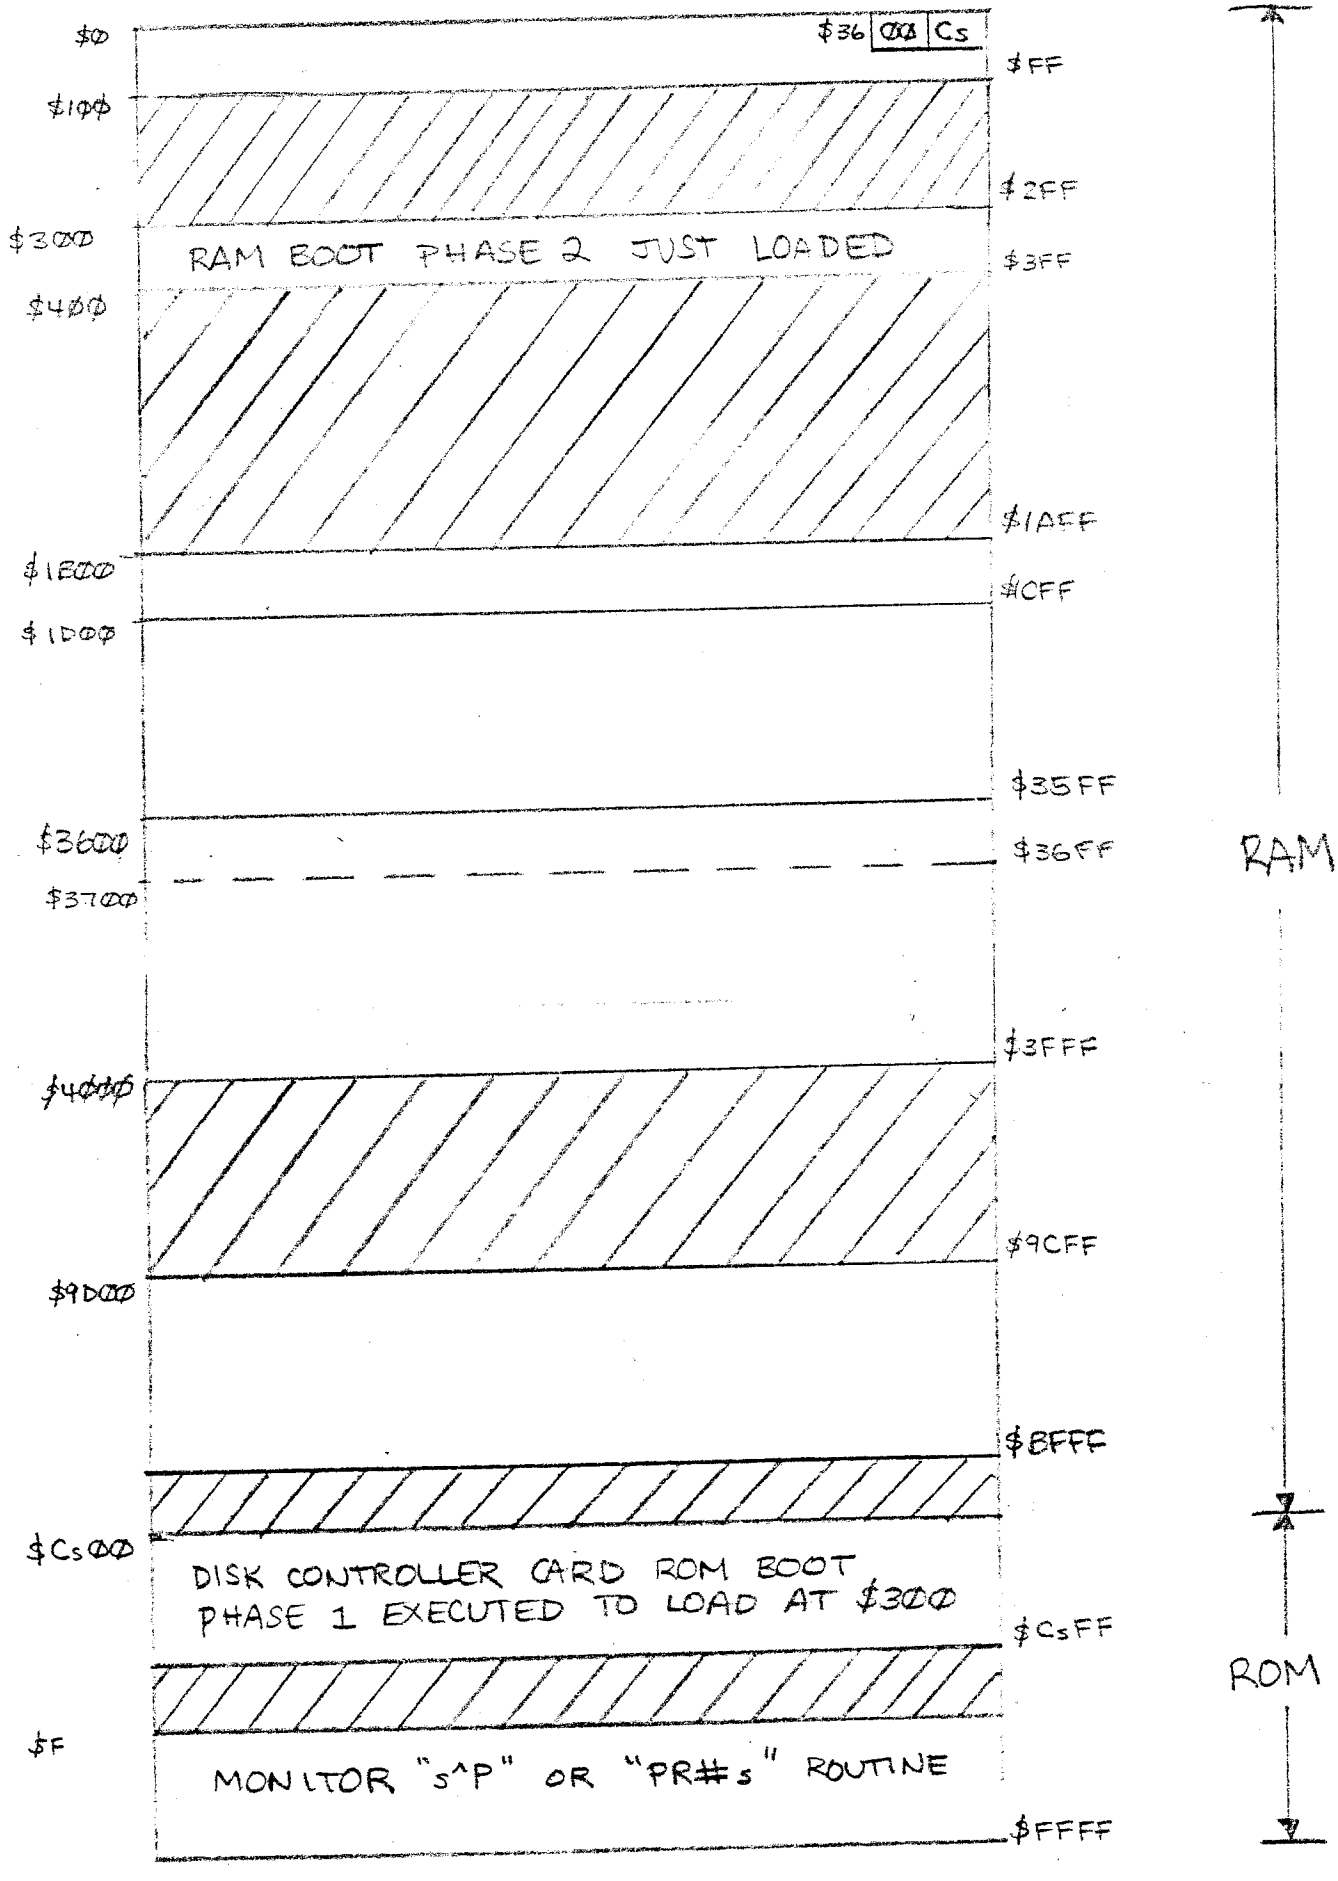
(g) RELOCATOR JUMPS (AT $1C03) TO DOS COLDSTART TO INITIALIZE DOS.

(G) DOS COLDSTART AT $2D84 BEGINS EXECUTION

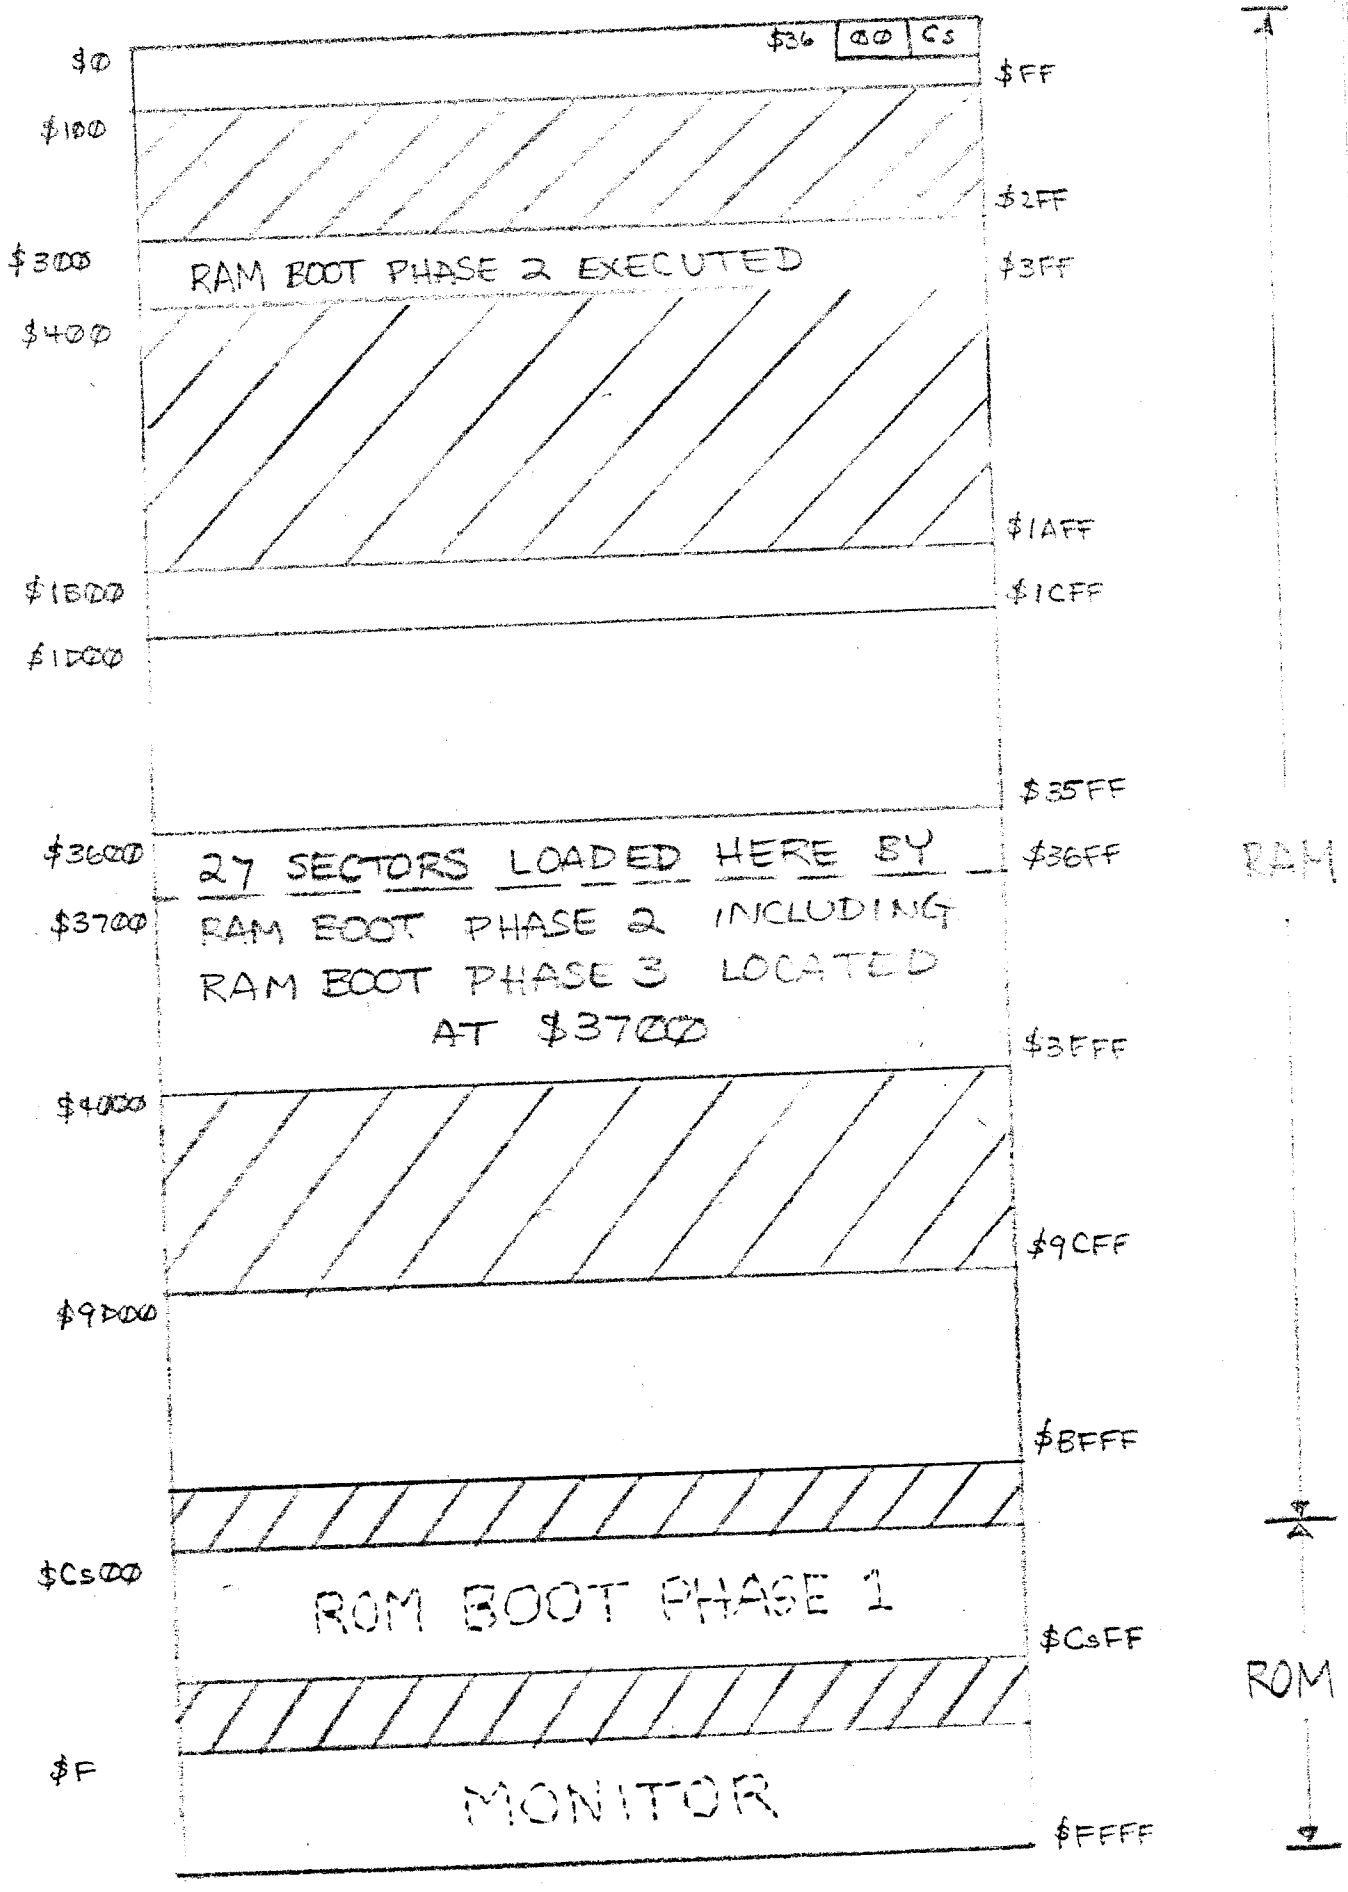
(a) "COLDSTART" INITIALIZES THE NOW BOOTED AND RELOCATED OPERATING SYSTEM

(b) INITIALIZATION OCCURS AND PROPER BASIC (INTEGER OR FLOATING, ROM OR ROM CARD) IS GIVEN CONTROL

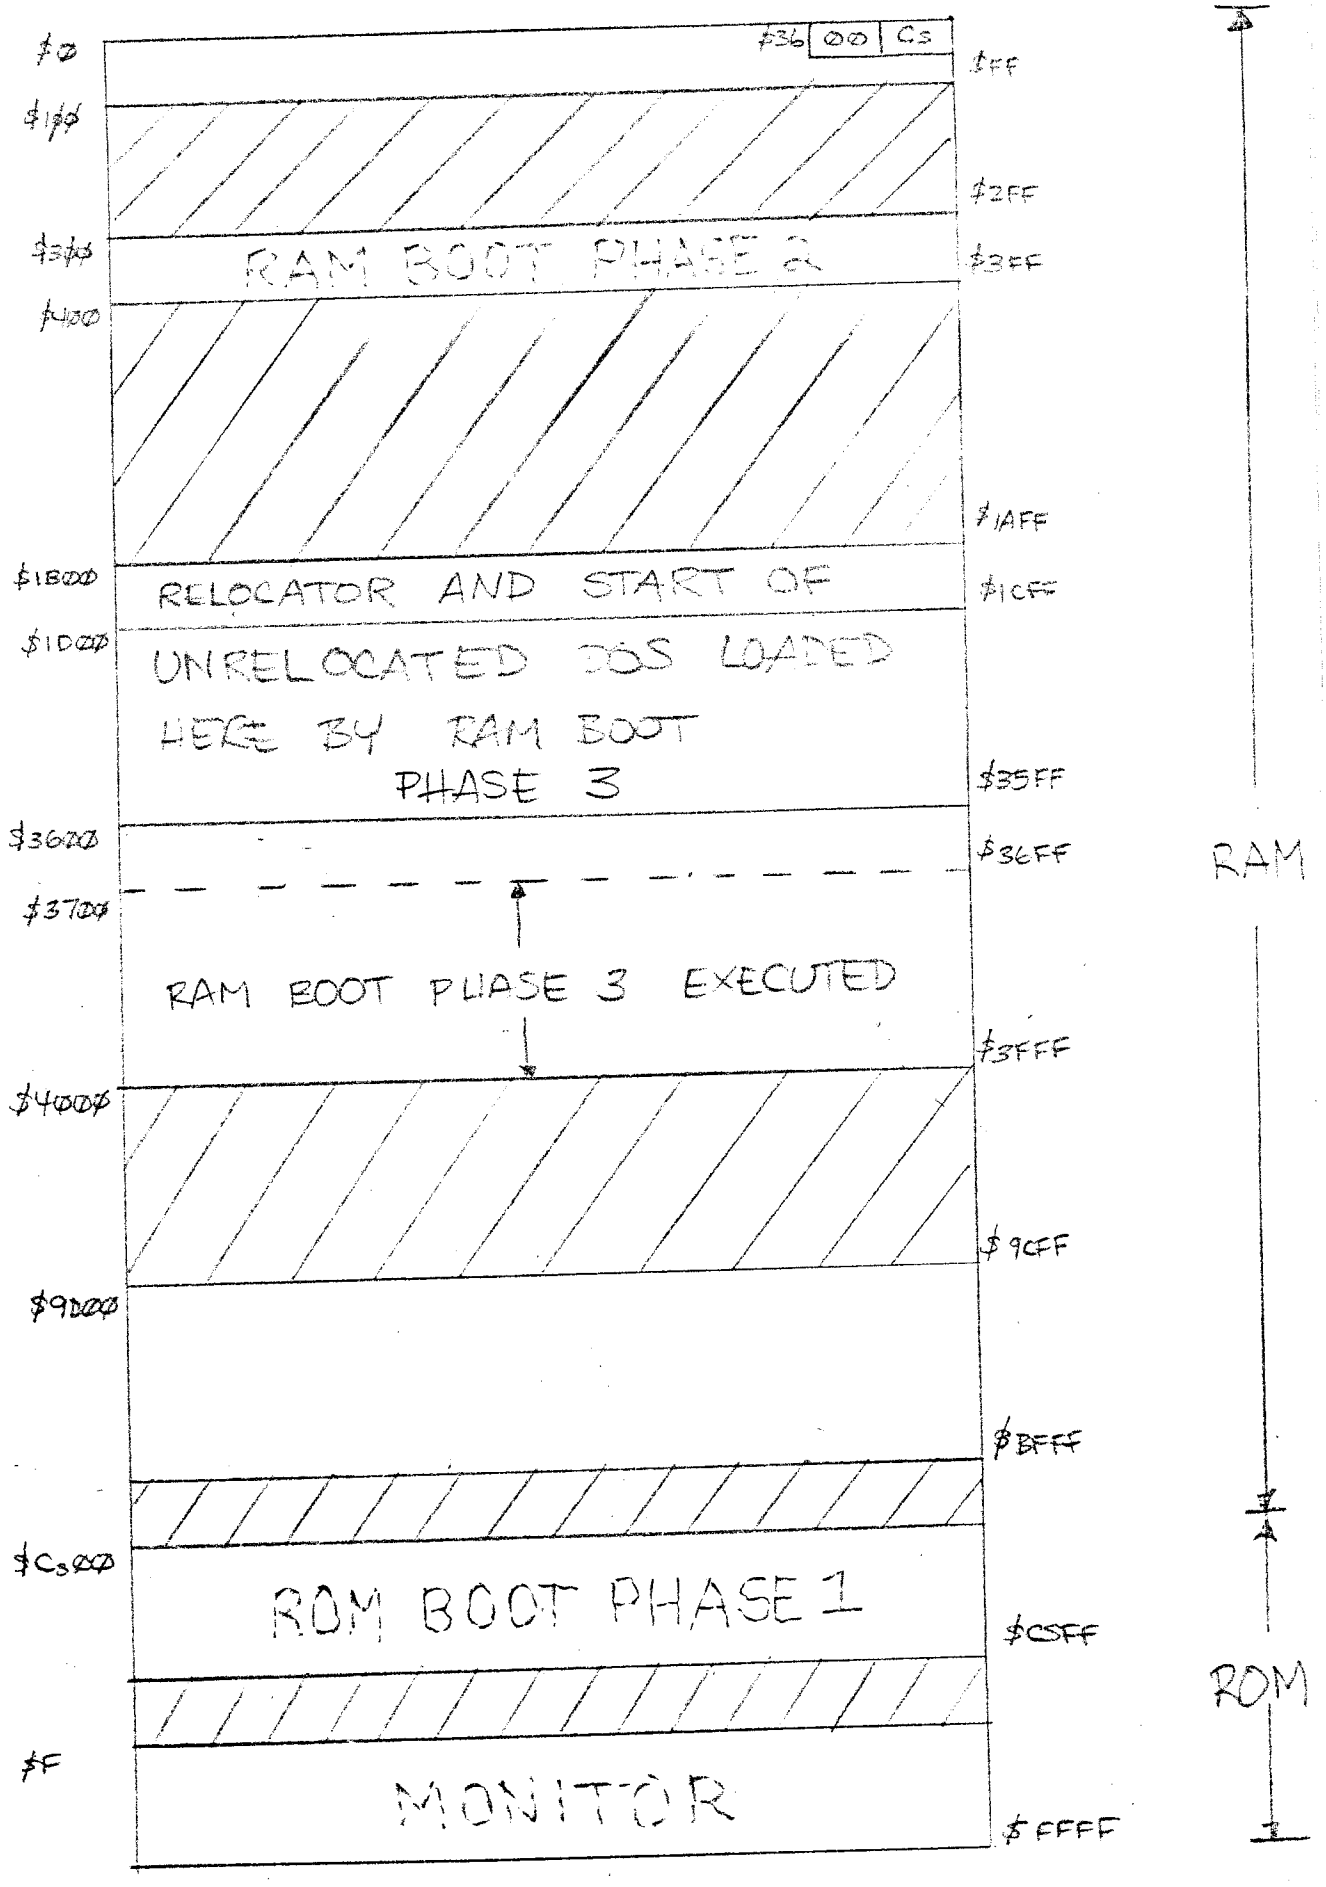
MEMORY MAP ON 48K APPLE AFTER STEPS (1) AND (2) OF A DOS MASTER DISKETTE BOOT



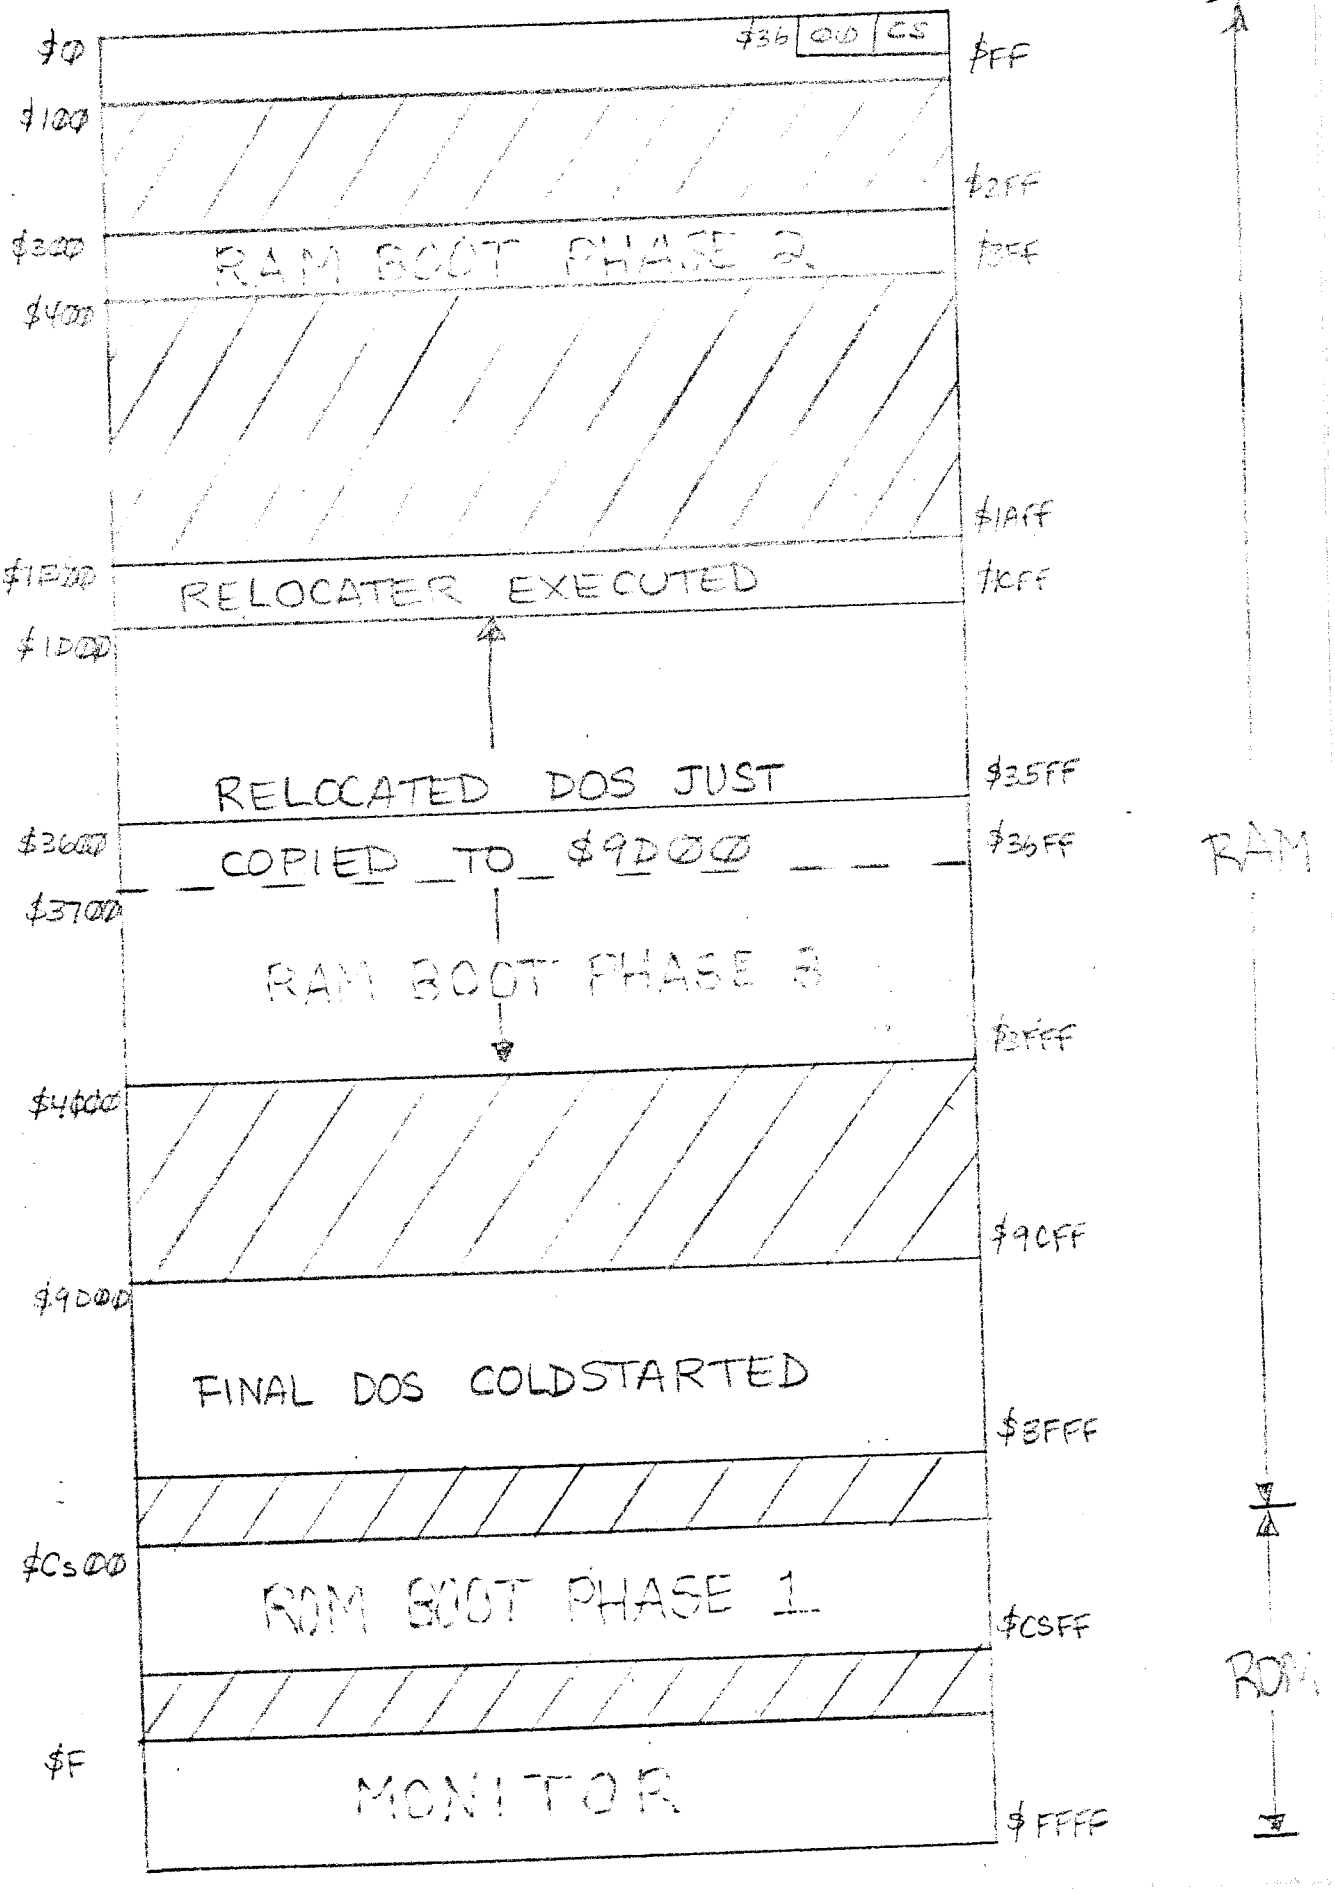
MEMORY MAP ON 48K APPLE AFTER STEP (3) OF DOS MASTER BOOT.



- MEMORY MAP ON 48K APPLE AFTER STEP (4) OF DOS MASTER BOOT



MEMORY MAP ON 48K APPLE AFTER STEP (5) & (6) OF DOS MASTER BOOT



DOS DISK II ROM BOOTSTRAP

NOTES

1. It is not clear who uses the value at 43F4 created by first entry processing.

2. DOS 3.2 differs from 3.1 as follows:
   - ECHO INPUT prompts under MON O not MON I
   - BASIC used to be passed "←ED", now "ED" only for intercepted lines.
   - Some commands may not be entered in direct mode (READ, WRITE, POSITION, OPEN, APPEND)
   - DOS now automatically relocates an FP program from RAM FP BASIC to ROM FP BASIC and vice versa when it is loaded.
   - Lower case is now supported when disk files are read with INPUT statements.
   - Some commands are allowed to create a new file, others will not. Originally, any reference to a file that didn't exist created one which might have to be deleted (LOAD X created then deleted X)
   - Contents of the X register at entry to the File Manager (FIO) indicates whether a new file may be created.

     X=0 create new file

     X=-1 file must already exist
   - References in FIO to DOS close subroutine require that all of DOS must be preserved

when using FIO.

- After entering the Monitor and then warmstarting DOS, a 48:00 is no longer necessary.
- All of DOS patch area is gone
- RWTS now disables from interrupts while in operation.
- B (Byte offset) is now 0 by default

3. a CTL-D output or any KSWL call force an exit from write mode.

4. FIO write range of bytes. Length must be one less that that desired.

5. DOS 3.2 documentation was incorrect in several areas:

Pg. 130 Deleted file track ptr is stored as the last byte in file name.
"END MARK" is really high byte of sector count.

Pg. 132 30-33 are: 30 track now being allocated
31 direction of track allocation
(+1, toward track 35
-1, toward track 0)

- 32, 33 } NOT USED

6. Hidden restrictions. DOS can not handle more than 16 sectors per track or more than 50 tracks per disk.

7. The DOS version number is always at $B3BE (or as appropriate to machine size). It is 02 for DOS 3.2.

8. All file type bit patterns are now defined:

00	Text	08	Sequential?
01	Integer	10	Random?
02	Applesoft	20	Applesoft? LOADable
04	Binary	40	B?
